

BigCommerce Integration

Configuration on the BigCommerce Dashboard

Create API Account

1. Sign in to your BigCommerce Merchant Dashboard.
2. Navigate to: Settings → Store-level API accounts (API)
3. Click on **Create API Account**.
4. Select the token type: **V2/V3 API Token**.
5. Provide a meaningful name for the API account.
6. Under **OAuth Scopes**, enable the following permissions:
 - Customers – Read-only
 - Information & Settings – Read-only
 - Orders – Modify
 - Order Transactions – Modify
 - Create Payments – Create
 - Products – Modify
 - Store Locations – Modify
 - Store Inventory – Modify
 - Fulfillment Methods – Modify
 - Order Fulfillment – Modify
7. Click **Save**.

A `.txt` file containing your API credentials will be automatically downloaded.
8. You can view the created API account and its assigned scopes anytime from the **Store-level API accounts** section of the BigCommerce dashboard.

Configuration on Odoo

1. Navigate to Sales → Configuration → BigCommerce → BigCommerce Account.

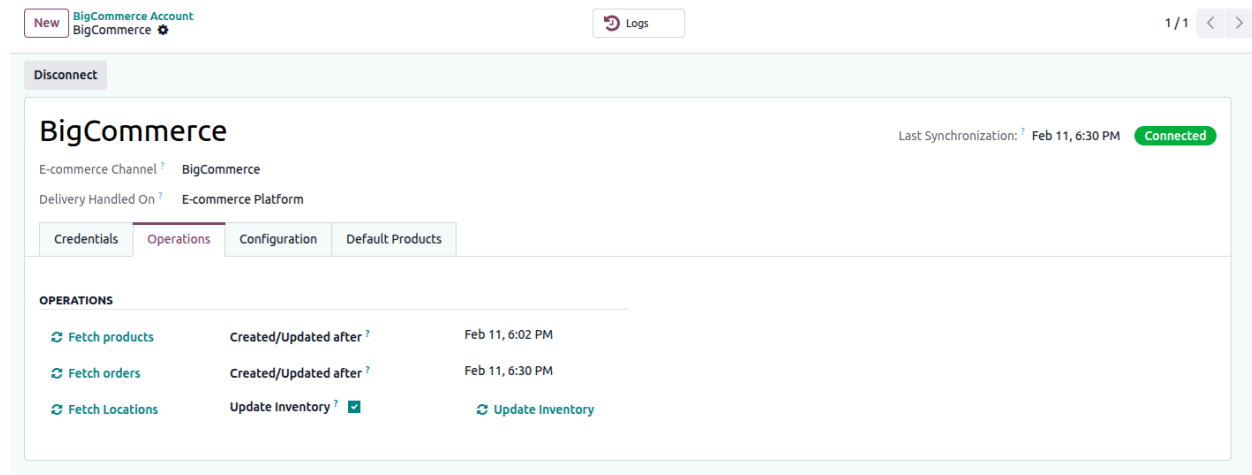

2. Enter the API credentials obtained from the BigCommerce dashboard.
3. Click on the **Connect** button.
4. If the credentials are correct, the provider status will be updated to **Connected**.
5. Once connected, you can perform various operations between Odoo and BigCommerce based on the selected **Delivery Handled By** option.

Operations

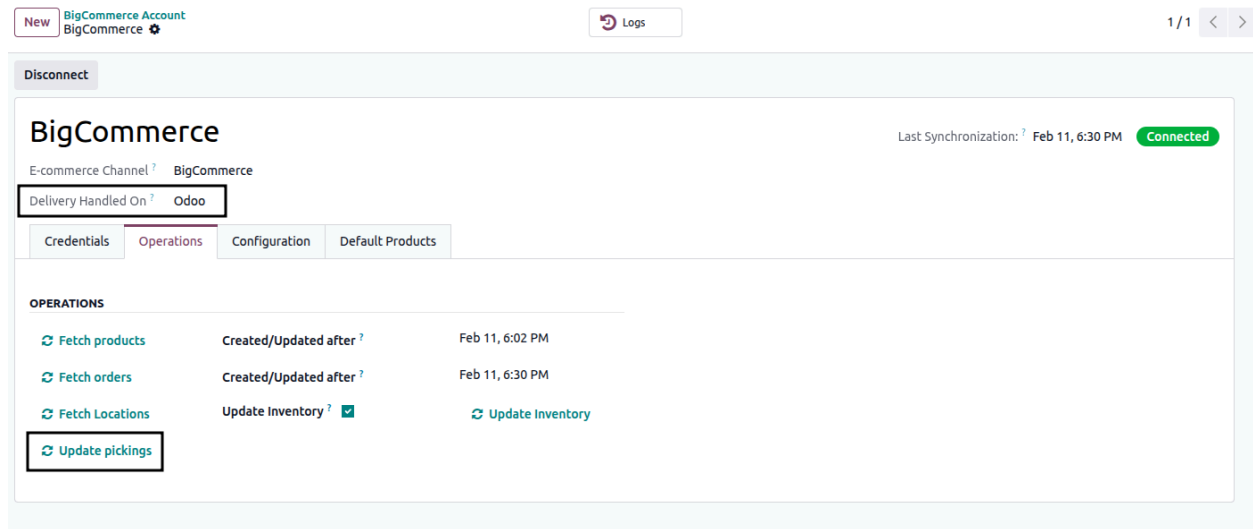

After successfully connecting BigCommerce with Odoo, the **Operations** tab allows you to synchronize key data between the two platforms.

This section provides on-demand actions to import products and orders, fetch store locations, and update inventory depending on your fulfillment configuration.

- **Fetch Products**
Imports products from BigCommerce into Odoo. You can use the *Created after* filter helps retrieve only the orders that were updated after a specific date.
- **Fetch Orders**
Imports sales orders from BigCommerce into Odoo. The *Updated after* filter helps retrieve only the orders that were updated after a specific date.
- **Fetch Locations**
Retrieves the configured store or warehouse locations from BigCommerce to support inventory and fulfillment workflows.
- **Update Inventory**
Pushes stock quantities from Odoo to BigCommerce to keep product availability accurate on the storefront. This operation can be enabled using the **Update Inventory** option.
- **Sync Inventory Option**
When enabled, inventory updates can be included automatically during synchronization runs.

Update Pickings (Only for Odoo Fulfillment)

When the **Delivery Handled By** option is set to **Odoo**, an additional operation becomes available:

- **Update Pickings**
Sends delivery order (picking) updates from Odoo back to BigCommerce, ensuring that shipment and fulfillment statuses remain consistent across both systems.

This option is not displayed when fulfillment is managed directly by the e-commerce platform.

The **Last Synchronization** timestamp shown at the top helps track the most recent successful operation.

Support

For any queries or support requirements, please schedule an appointment using the link below. Our team will assist you with onboarding, configuration, and troubleshooting:
